

Workflow Configuration Design Travtus Adam Implementation Client: Cortland-Style Multifamily Operator | 8,000 units across 12 properties

Discovery Summary

Client Profile

A US-based multifamily property operator running 8,000 residential units across 12 properties in 4 metropolitan markets. Annual gross revenue is roughly \$145M. The resident base skews young professional and graduate student, so digital expectations are high and patience for slow responses is low.

Current Operational State

Inbound resident communication arrives across four channels: the Yardi RentCafe portal, direct email, phone calls, and SMS to the leasing office line. There is no unified inbox. Each property's site team manually triages messages as they come in, opens Zendesk tickets where needed, and forwards everything else to maintenance, billing, or leasing teams via internal email.

Average first response time across the portfolio is 14.2 hours. Maintenance issues take an average of 3.8 days to resolve. Resident satisfaction sits at 3.6 out of 5 in their quarterly survey, with communication consistently flagged as the lowest-scoring category.

Stated Goals for the Adam Deployment

- A single inbound communication view across all four channels
- Automated triage and routing of resident messages by intent
- First response time reduced from 14 hours to under 2 hours
- At least 35% of inbound messages resolved by Adam without human escalation
- Real-time visibility for management into what's happening across all 12 properties

Existing Tech Stack

Yardi Voyager for property management, Yardi RentCafe for the resident portal,

Zendesk for ticketing and support, SendGrid for transactional email, Salesforce for the leasing pipeline, and Slack for internal team communication.

Constraints Identified

Yardi Voyager's API is rate-limited, so any bulk data pulls have to be batched overnight. Site teams are spread across 12 locations with different operational rhythms. Resident PII has to be encrypted in transit and at rest, and Adam's responses cannot expose account numbers, balances, or lease details to unauthorised channels. Some properties are in jurisdictions with strict tenant communication laws around notice periods and arrears wording, so the workflow has to handle that without manual oversight on every message.

Solution Architecture

The architecture situates Adam between the four inbound channels and the client's existing systems of record. Adam handles the AI layer (intent classification, response generation, escalation logic), but it doesn't replace any of the underlying systems. Yardi remains the source of truth for tenant and lease data. Zendesk remains the ticketing system. The goal is to make Adam invisible to residents and useful to the operations team

Workflow Configuration Logic

The following logic defines how Adam handles inbound resident communication for this client. Each rule is written in pseudocode for clarity and maps directly to platform configuration.

Rule 1. Emergency Intent (Highest Priority)

```

IF message contains [keywords: flood, fire, gas leak, no heat, no water, break-in, smoke,
electrical sparking]
OR urgency_score >= 9
THEN
  → Send acknowledgement to resident within 60 seconds
  → Create Zendesk ticket with priority = URGENT
  → Notify property manager via Slack #emergency-alerts
  → Notify on-call maintenance lead via SMS
  → Log incident in Travtus Gateway dashboard with red flag
  → DO NOT attempt automated resolution. Human handoff is immediate.
  
```

Rule 2. Standard Maintenance Request (Business Hours)

```
IF intent = 'maintenance'
  AND urgency_score < 9
  AND current_time WITHIN business_hours
THEN
  → Acknowledge resident with expected response window (for example, "We'll have someone respond within 2 hours")
  → Query Yardi for unit details and recent maintenance history
  → Create Zendesk ticket with priority = NORMAL
  → Auto-assign to maintenance team for that property
  → Send Slack notification to maintenance supervisor
  → Schedule a follow-up acknowledgement to resident at the 2-hour mark if not yet resolved
```

Rule 3. After-Hours Maintenance

```
IF intent = 'maintenance'
  AND current_time OUTSIDE business_hours
  AND urgency_score < 9
THEN
  → Acknowledge resident: "We've received your request. A team member will respond by [next business day, 9am]."
```

```
  → Create Zendesk ticket with priority = NORMAL, status = QUEUED
  → DO NOT alert maintenance team overnight
  → Add to morning queue with timestamp for triage at 8:30am
```

Rule 4. Billing Query (Account in Good Standing)

```
IF intent = 'billing'
  AND Yardi_lookup.balance_due == 0
  AND Yardi_lookup.account_status == 'current'
THEN
  → Adam responds directly with payment due date, amount, and payment methods
  → No escalation needed
  → Log interaction in Gateway as 'auto-resolved'
```

Rule 5. Billing Query (Arrears or Disputed)

```
IF intent = 'billing'
  AND (Yardi_lookup.balance_due > 0 OR Yardi_lookup.account_status == 'disputed')
THEN
  → Adam acknowledges receipt without confirming any balance details
  → Escalate to property manager and finance team via Zendesk
  → Apply jurisdiction-specific compliance template (for example, arrears notice wording for that state)
  → DO NOT include balance figures in any automated response. PII boundary applies.
```

Rule 6. Leasing Inquiry (Existing Resident)

```
IF intent = 'leasing'
  AND sender_id matches current resident in Yardi
THEN
  → Categorise as renewal, upgrade, transfer, or break-lease query
  → Adam responds with high-level information and a link to RentCafe self-service
  → Create a Salesforce activity log (not a new lead)
  → Notify property manager for personal follow-up within 24 hours
```

Rule 7. Leasing Inquiry (Prospect)

```
IF intent = 'leasing'
  AND sender_id NOT in current resident database
THEN
```

- Treat as a new lead
- Adam responds with availability, pricing, and a tour scheduling link
- Create a Salesforce lead with source = 'Adam inbound'
- Auto-add to nurture sequence
- Notify leasing team if the prospect requests human follow-up

Rule 8. Ambiguous or Unclassifiable Message

```
IF intent_classifier_confidence < 0.7
  OR message contains < 5 words AND no clear intent signals
THEN
  → Adam responds with a clarifying question (max one follow-up)
  → IF follow-up is still ambiguous after one attempt
    THEN escalate to property manager queue with the original message and Adam's clarification attempt
  → Do not loop indefinitely. Human handoff happens after one failed clarification.
```

Rule 9. Compliance-Sensitive Communication

```
IF message intent involves [eviction notice, lease termination, harassment claim,
discrimination claim, accessibility request]
THEN
  → DO NOT generate an automated response
  → Acknowledge receipt with a neutral message: "We've received your message. A team member will be in touch directly."
  → Immediate escalation to property manager and compliance officer
  → Flag in Gateway with a compliance review tag
  → Log all subsequent communications in the audit trail
```

Rule 10. Repeat Contact (Same Issue)

```
IF resident has contacted >= 3 times about the same issue within 7 days
  AND associated Zendesk ticket is still OPEN
THEN
  → Auto-escalate to senior property manager
  → Apply 'at-risk' tag in Gateway
  → Notify regional manager if escalation count = 5+ across the portfolio in the same week (systemic issue indicator)
```

Acceptance Criteria

Before Adam goes live for this client, every test below must pass. Each test runs against the configured workflow logic in a sandbox environment, using historical resident communications as input.

#	Test Case	Input	Expected Behaviour	Pass Criteria
1	Emergency intent, flood after hours	Tenant SMS at 02:14: "Water gushing from ceiling, flat is flooding"	Acknowledgement under 60s, on-call SMS triggered, Slack alert, Zendesk URGENT ticket	All 4 actions complete within 60s, no AI resolution attempted

#	Test Case	Input	Expected Behaviour	Pass Criteria
2	Standard maintenance, business hours	Email 10:30am: "Dishwasher won't drain"	Acknowledgement within 5 min, Zendesk NORMAL ticket, maintenance team Slack notified	All actions within 5 min, ticket auto-assigned to correct property's team
3	Billing query, account current	Portal message: "When is my next rent due?"	Adam queries Yardi, returns due date and amount	Correct figures returned, no human escalation, response within 30s
4	Billing query, arrears account	Email: "Why was I charged a late fee?"	Adam acknowledges receipt, escalates to finlease."ance, jurisdiction-specific template applied	No balance details exposed in automated response, finance team notified within 5 min
5	Existing resident, renewal inquiry	RentCafe message: "I want to renew my lease"	Categorised as renewal, Salesforce logged, PM notified for follow-up	Activity logged, no new lead created, PM notified within 1 hour
6	New prospect, pricing inquiry	Email from external address: "Do you have any 1-beds available in October?"	Adam responds with availability and tour link, Salesforce lead created	Lead created with correct source, nurture sequence triggered
7	Ambiguous message	SMS: "It's broken"	Adam asks one clarifying question	After clarifying, correct intent is captured. Escalation triggers if still ambiguous.
8	Compliance-sensitive	Email: "I want to give 30 days notice and dispute my deposit"	Neutral acknowledgement, no AI response, immediate human escalation	Zero automated content beyond acknowledgement, full audit trail captured

#	Test Case	Input	Expected Behaviour	Pass Criteria
9	PII boundary check	Maintenance request from a different unit's resident referencing another tenant by name	Adam responds only with information relevant to the sender's unit	No data from other tenants exposed in any response
10	Rate limit handling	Burst of 200 simultaneous inbound messages during a building-wide power outage	Adam queues, prioritises by urgency, no message lost	All 200 messages acknowledged within 10 min, urgent ones flagged within 60s

30-Day Success Metrics

The success of this deployment is measured against five KPIs 30 days post go-live. Baselines are taken from the client's pre-deployment data.

Metric	Pre-Deployment Baseline	Day-30 Target	Day-30 Measurement Method
Average first response time	14.2 hours	Under 2 hours	Mean time from inbound message timestamp to first reply across all channels
Ticket deflection rate	0% (all manual)	At least 35%	% of inbound messages resolved by Adam without human escalation
Escalation accuracy	N/A	At least 90%	% of escalated tickets that genuinely required human action (random sample audit)
Resident communication score	3.6 / 5	At least 4.0 / 5	Quarterly survey, communication category specifically
Data completeness at go-live	~68% (estimated)	At least 95%	% of resident records passing pre-launch validation checks

Risk Monitoring

Three risks are tracked weekly during the first 30 days. False escalation rate measures when Adam escalates issues that should have been auto-resolved, with a

target of under 5%. Missed escalation rate measures when Adam attempts to resolve issues that required human attention, with a target of under 2% and zero tolerance for compliance-sensitive cases. Resident sentiment trend is assessed through a manual review of 50 random resident interactions per week, scored for tone and resolution quality.

If any of these breach the threshold for two consecutive weeks, the workflow logic is reviewed and reconfigured before scaling further.

Closing Note

This document covers the configuration design for the initial Adam deployment. It is intentionally narrow in scope, focusing only on resident communication workflows for the first 30-day rollout. Later phases, such as renewal automation, lead nurturing, and predictive maintenance scheduling, will be designed and configured in separate engagements once the foundation is proven stable.

The decisions in this document are intended to be defensible. Each rule includes a clear trigger, a defined action, and a measurable success criterion. Where escalation paths are ambiguous, the bias is always toward human handoff rather than automated resolution. This applies particularly to compliance-sensitive cases, billing disputes, and emergencies.

Success here is not measured by the number of automated actions Adam takes. It is measured by the absence of failures. No missed emergencies, no compliance breaches, and no resident left without acknowledgement.
